TECHNICAL SKILLS

Programming Languages: Java, C, C++, Python, HTML/CSS, JavaScript, MATLAB, Assembly, Ruby, Ocaml
Libraries/Frameworks: Node JS, Express, Jupyter, MongoDB, Neo4j, Flask, Pandas/NumPy, Junit, Apache, Ajax, jQuery, Bootstrap

EXPERIENCE

Acclaim Technical Services (ATS)

Full Stack Developer/SWE Intern – Summer 2023

- Collaborated with a team of 3 to create a full-stack graph application that significantly streamlined the HR department's candidate management process.
- Utilized Python/Flask and Django to develop and design the RESTful API endpoints allowing communication between front and backend components.
- Incorporated Alchemy.js (open-source graph visualization library) to visualize data as nodes and edges.
- Integrated HTML, CSS, JS, jQuery, and Ajax to create dynamic web pages for data interaction and visualization.
- Developed CSV parser which extracts information to generate Cypher queries for ingestion into Neo4j database.

SWE/Extended Reality (XR/VR) Intern – Summer 2022

- Utilized Flask (Python Library) and RESTful API to help test and develop the backend of a government prototype. Leveraged HTML to develop and update the front-end of the prototype.
- Employed RESTful API methods to ingest data such as coordinates onto a Cesium GIS mapping system.
- Tested pre-released software such as Virtualitics (Advance AI Analytics Tool) to filter out data from large datasets (over 180,000 points) to create a pleasing representation and analysis for the customer.
- Deployed Blender to create a variety of 3D models to ingest into virtual reality worlds.
- Showcased tasks and tools utilized through an interactive VR Presentation (via Spatial) to the ATS Team

PROJECTS

Autonomous OTV Rover, *C++, Arduino, Circuit Lab, WIFI Vision System*

- Created an autonomous rover capable of navigating a course via ultrasonic sensors and WIFI vision system
- Optimized power output to motors for enhanced course/task completion and navigation
- Lead a team of 7 to build a rover capable of extinguishing and reporting flames using snuffers, flame sensors, WIFI module, and servo motor; budgeted project using Microsoft Excel

Weather Application, *HTML/CSS, JavaScript, MongoDB, Node.js, Express, RESTful API*

- Developed a weather application that displays weather information based on the city the user inputs
- Used Node.js and Express to develop the server-side(backend) of the application. Express handles HTTP requests and performs specific tasks.
- Integrated Mongo DB to store and manage weather information, allowing users to access their search history
- Implemented RESTful API to retrieve and fetch real-time weather information using an API

Impact of Per Game Stats on NBA Team Success, *Python, HTML, NumPy/Pandas, BeautifulSoup*

- Gathered and parsed over 9000 data points regarding the top 50 teams from an NBA database. Focused on the top teams between 2010-2020
- Utilized NumPy, Pandas to bring a thorough analysis of a team's success based on their season's statistics

Shell Simulator, *C, Makefiles*

- Developed the guts of a shell that supports Boolean operations, pipes, and file redirection
- Demonstrated proficiency in C programming by utilizing advanced features such as pointers, input/output redirection, makefiles, threads, and processes

EDUCATION

University of Maryland, College Park **May 2024**

Department of Computer Science, Computer Science Major

Robert H. Smith School of Business, General Business Minor

Relevant Coursework: Data Science; Data Structures; Web Application Development; Object-Oriented Programming; Discrete Structures/Mathematics; Computer Systems; Organization of Programming Languages; Algorithms; Calculus I/II; Differential Equations, Applied Probability and Statistics; Physics I/II; Intro to Electrical & Computer Engineering; Digital Logic Design; Engineering Design
